

Lots of people out there

Lots of people have phones

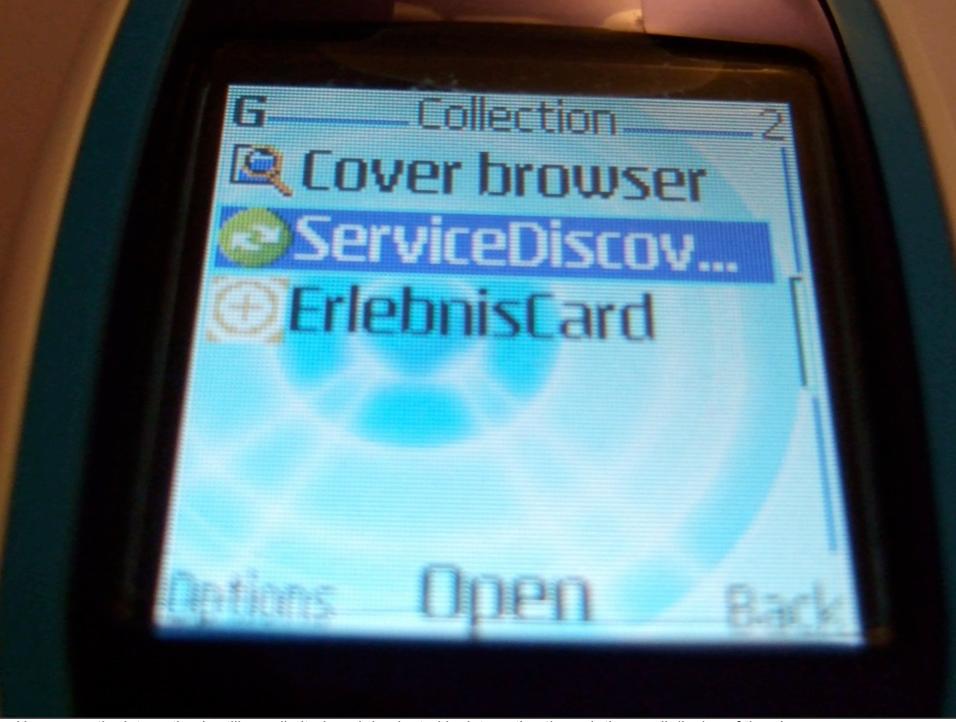

NFC/RFID is emerging tech for tangible interaction – mostly for payment

Starting to crop up in all sorts of places

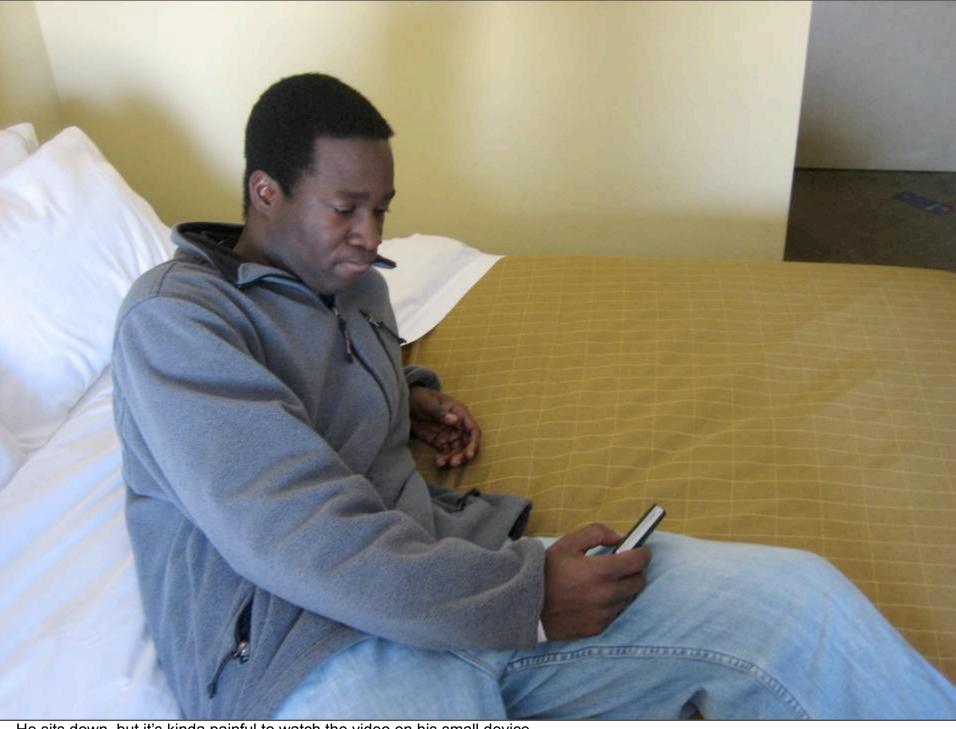

NFC extends RFID to provide a mechanism for two-way data transfer

However – the interaction is still very limited, and dominated by interaction through the small display of the phone

So – consider the scenario where trusty Yaw is returning home, and he has been watching a video on his phone

He sits down, but it's kinda painful to watch the video on his small device

So, he turns on the TV to see what is playing

He really likes it, so he makes a simple gesture to capture the program so he can view it later

Now he can easily check the details of the program, saved for later viewing

So, now he can happily finish watching his program...

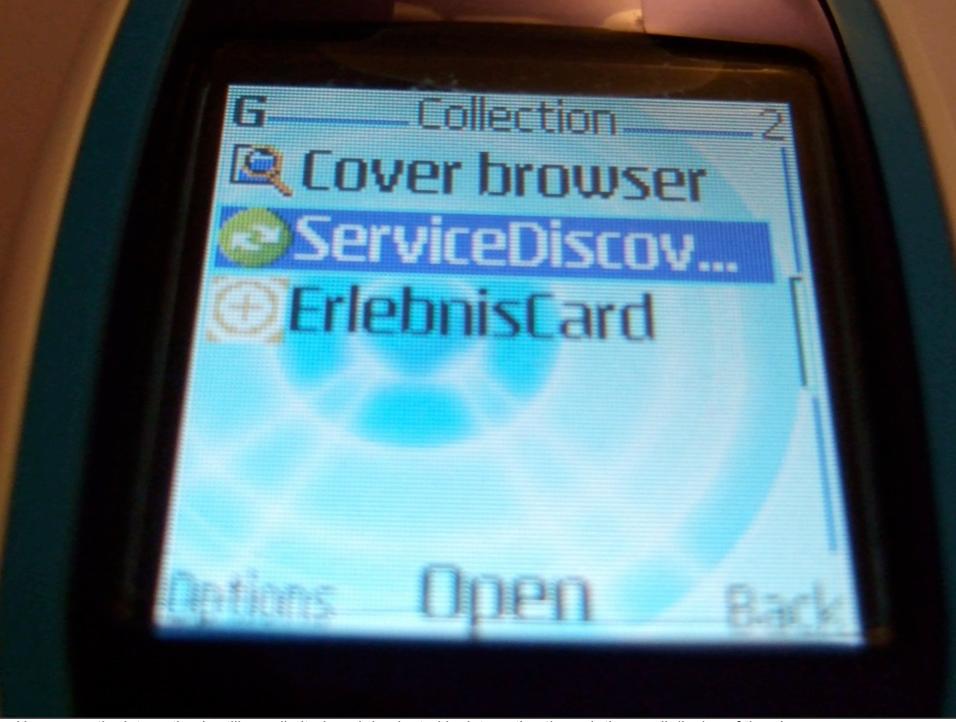

Or to capture the location and/or menu for later return, if he doesn't find anything better

Also can be used to easily push his room temperature settings to the thermostat

Alternately, he can use the on-screen interface to do a Bluetooth scan or something similar to discover the TV and push his content – not very convenient.

However – the interaction is still very limited, and dominated by interaction through the small display of the phone

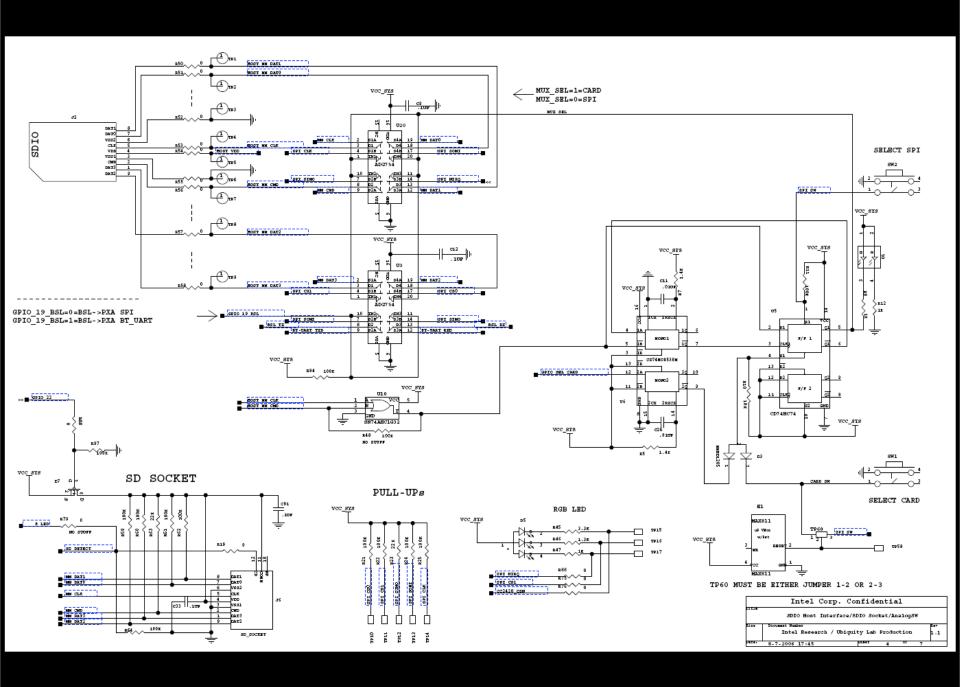

So, what we wanted to do was extend the capability of the phone

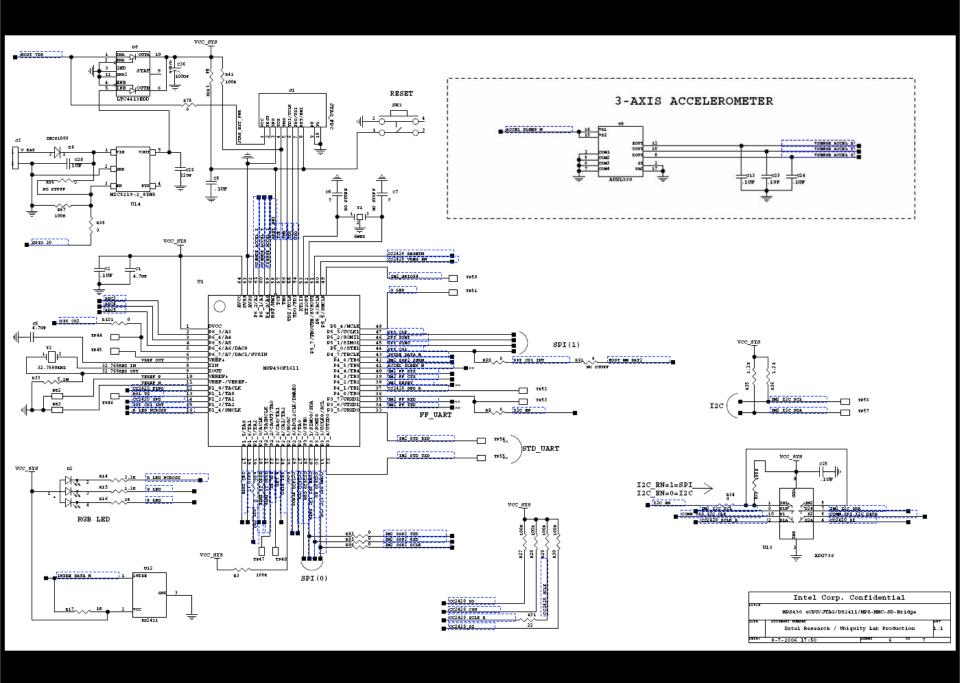

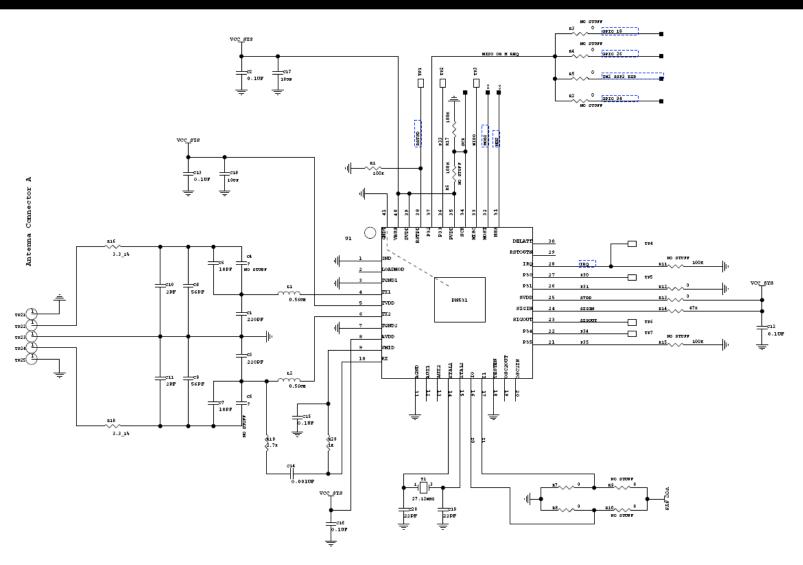

Using a standard SD-card interface

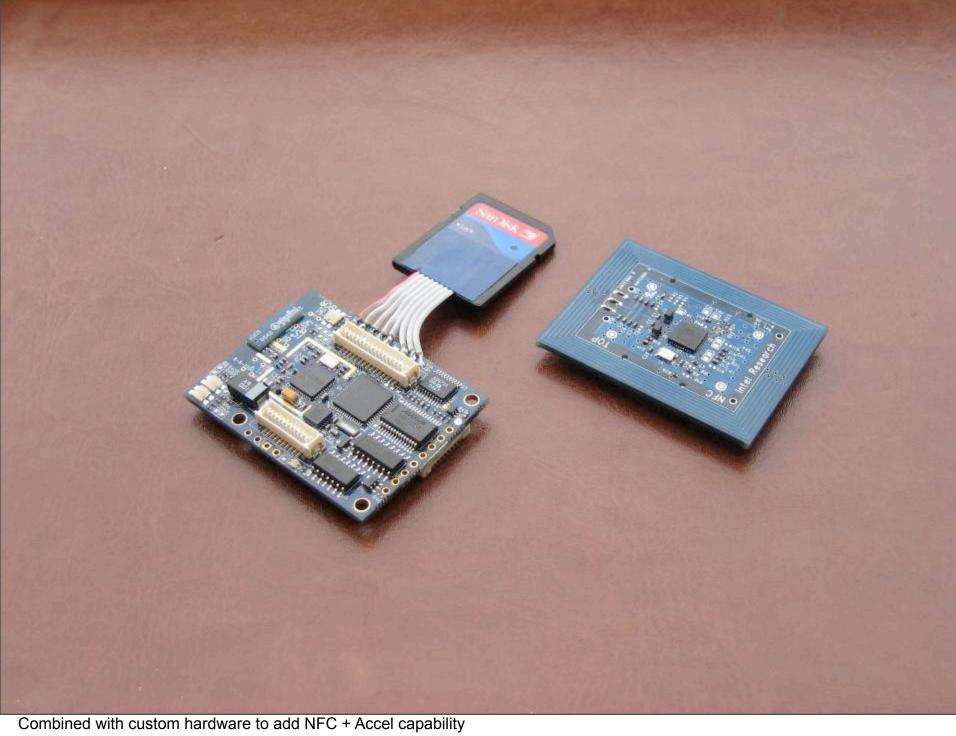

To form a prototype system allowing people to explore emerging interaction techniques with such devices

```

Which is fairly common (but not ubiquitous) for multimedia capable devices.

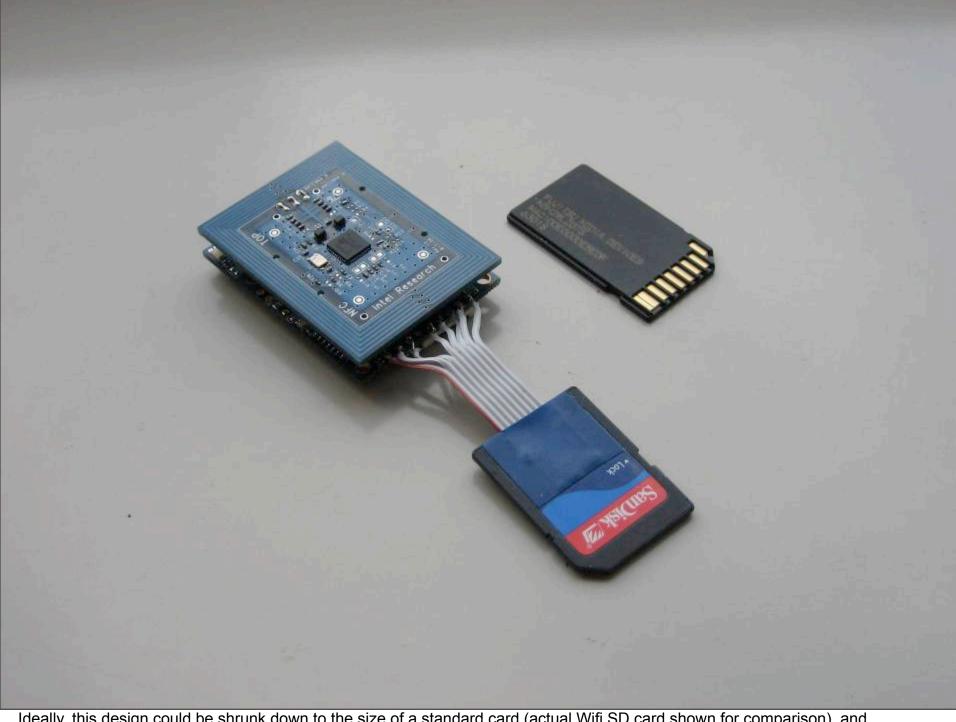

So, he turns on the TV to see what is playing

He really likes it, so he makes a simple gesture to capture the program so he can view it later

Combined with custom hardware to add NFC + Accel capability

Ideally, this design could be shrunk down to the size of a standard card (actual Wifi SD card shown for comparison), and eventually integrated into the phone

NFC extends RFID to provide a mechanism for two-way data transfer

ばiPhone

3.5 inches

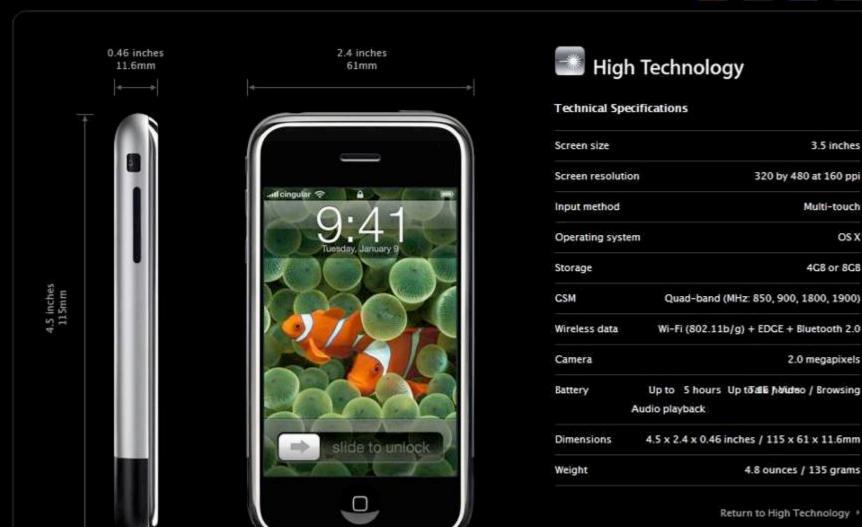

Multi-touch

4GB or 8GB

2.0 megapixels

OS X

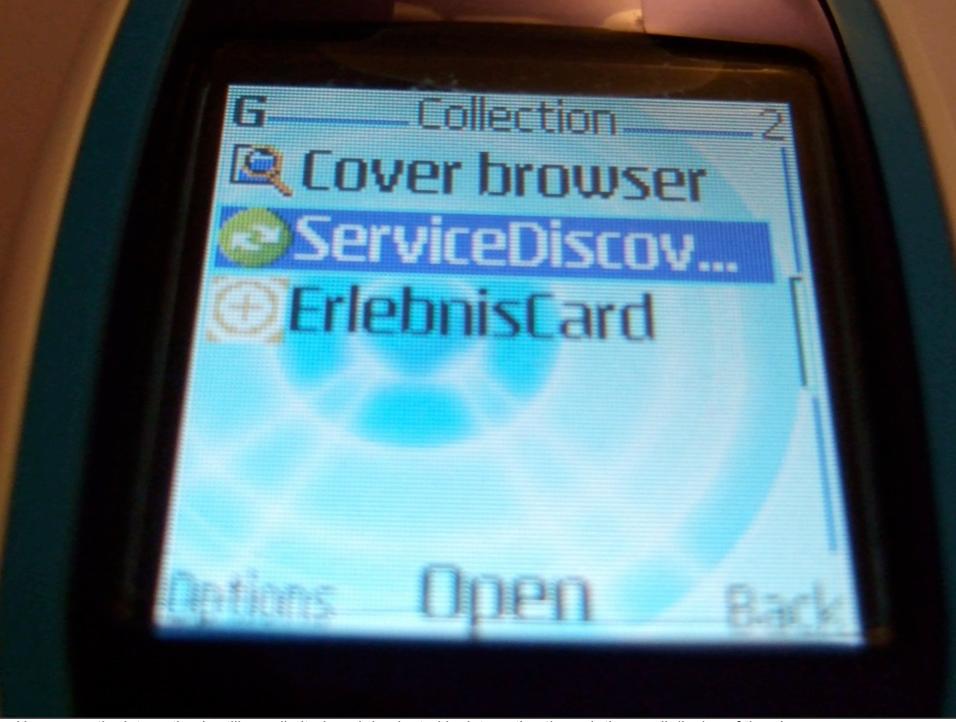

320 by 480 at 160 ppi

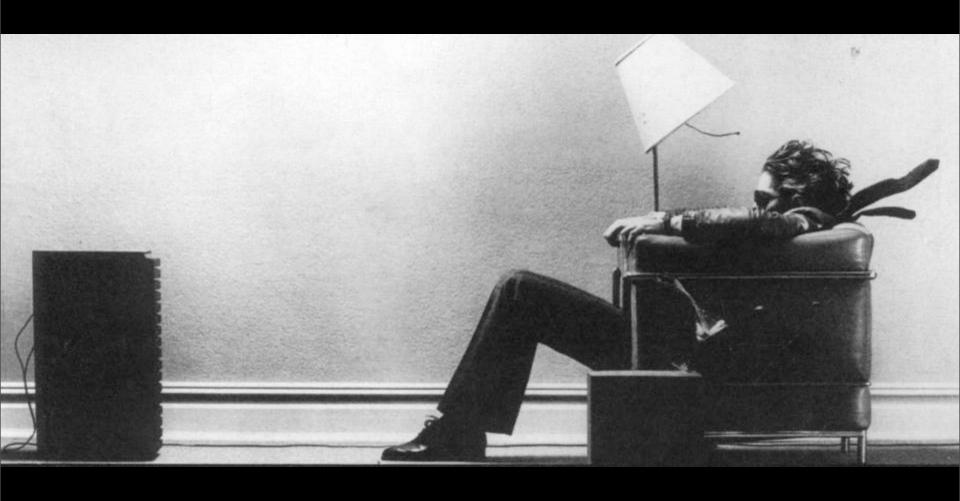

Point of the project is to explore phone-centric novel tangible interaction techniques that can eventually be easily pushed to the mass market. The iphone – BTW – has an accelerometer in it... but no NFC...

To these people

However – the interaction is still very limited, and dominated by interaction through the small display of the phone

Which is fairly common (but not ubiquitous) for multimedia capable devices.

Conclusions/Summary

Extend phones with NFC + Gestures

Use simple gestures for simple commands

Towards wide-spread use of streamlined tangible interaction
